

SYSTEM FOR CONDUCTING FORTUNE TELLING AND
CHARACTER ANALYSIS OVER INTERNET
BASED ON NAMES OF ANY LANGUAGE

5

FIELD OF THE INVENTION

The present invention relates to a system for
conducting fortune telling and character analysis over
Internet based on implied meanings of names of any
10 language.

BACKGROUND OF THE INVENTION

Fortune telling and character analysis is an ancient
15 and profound knowledge developed in the Chinese
culture to predict a person's future. There are
various ways of deduction and different elements used
in the Chinese fortune telling and character analysis,
including the four-pillar theory, the "Chi-Wei-
20 Dou-Su", the horoscopes, the astrology, etc. Up to
date, all these deduction ways and elements for fortune
telling and character analysis are based on names in
Chinese, either traditional or simplified Chinese,
and/or the date of a person's birth indicated by the
25 lunar calendar, and they are not applicable to names
in non-Chinese language.

However, there are many occasions for a person to use
a name in non-Chinese language, particular in English,

rather than the name in Chinese, such as in applying for a credit card, passport, etc. For most Chinese, their non-Chinese name may be a transliteration of the Chinese name or a common name in any foreign language.

5 In either case, none of the currently available ways for fortune telling and character analysis could satisfy a person who wishes to know whether his or her non-Chinese name represents any good or bad sign.

10 Due to the mystic nature of the fortune telling and character analysis, it has been suggested as a means to promote business over Internet. That is, commercial organizations may include the fortune telling and character analysis in their web sites to
15 attract more people to browse their web site and therefore create more chances of successful commercial transactions over Internet. For this purpose, it is desirable to develop a system that enables fortune telling and character analysis to be conducted over
20 Internet based on not only Chinese names but also non-Chinese names.

SUMMARY OF THE INVENTION

25 It is therefore a primary object of the present invention to provide a system for conducting fortune telling and character analysis over Internet based on implied meanings of names of any language, and providing judgments on good or bad signs possibly

represented by such names.

The system of the present invention mainly includes a host, a database, one or more terminals, and a communicating system connecting the host, the database and the terminals to one another. When a user enters a name in any language, including a surname and a given name, at a terminal via an interface provided by the host, the database is capable of comparing the entered name with data stored in the database and locating any data that match with or correspond to the entered name, and then analyzing the implied meanings of the entered name to provide judgments on good or bad signs possibly represented by the entered names.

The database is able to analyze the implied meanings of a name in any language either based on numbers of strokes of the entered surname and given name or based on meanings or origins of words constituting the entered surname and given name.

The system of the present invention allows users to enter names in any language and is able to conduct a quick fortune and character analysis based on the entered name. By including the system of the present invention in a web site through Internet, it is possible to attract more people to browse the web site.

BRIEF DESCRIPTION OF THE DRAWINGS

The structure and the technical means adopted by the present invention to achieve the above and other objects can be best understood by referring to the following detailed description of the preferred
5 embodiments and the accompanying drawings, wherein

Fig. 1 is a schematic view showing the system according to the present invention for conducting fortune
10 telling and character analysis over Internet based on a name in any languages;

Fig. 2 is a flowchart showing the operation of the system of the present invention of Fig. 1;

Fig. 3 is a schematic view showing the system according to the present invention for conducting fortune
15 telling and character analysis over Internet based on number of strokes of a name in any languages;

Fig. 4 is a flowchart showing the operation of the system of Fig. 3;

Fig. 5A explains the relation between the number of
25 strokes of a name and the fortune of a person having the name as defined in the traditional Chinese fortune telling theory;

Fig. 5B is a table explaining the relation between the

number of strokes of a name and the fortune of a person having the name as defined in the system of the present invention;

- 5 Fig. 6 shows data stored in a database in the system of the present invention shown in Fig. 3;

Fig. 7A shows a first example of analyzing a name in English with the system of the present invention;

10

Fig. 7B shows a second example of analyzing a name in English with the system of the present invention;

- 15 Fig. 7C shows a third example of analyzing a name in English with the system of the present invention; and

- Fig. 8 shows examples of data stored in a database in a system of the present invention for character analysis based on meaning of word constituting a name
20 in English.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

- Please refer to Fig. 1 that shows a system according
25 to the present invention for conducting fortune telling and character analysis over Internet based on a name in any languages. The system mainly includes a plurality of terminals 1, a host 3, and a database 31 connected to one another via a communicating system

2. In the database 31, data for fortune telling and character analysis based on implied meanings of a name in any language are stored. The communicating system 2 employed in the present invention is Internet.

5

Please refer to Fig. 2 that is a flowchart showing the operation of the system of the present invention shown in Fig. 1. An end user at a terminal 1 is connected to the host 3 via the communicating system 2, which is Internet in the present invention. The host 3 provides an input interface that is transmitted to the terminal 1, so that the terminal 1 receives the same input interface transmitted by the host 3. When the end user enters at the terminal 1 a name, including a surname and a given name in any foreign language, the entered name is transmitted to the host 3. When the host 3 receives the entered name from the terminal 1, the database 31 analyzes implied meanings of the entered surname and given name based on data stored therein and provides a judgment on any good or bad sign possibly represented by the entered name. The judgment is then transmitted from the host 3 to the terminal 1 for displaying on a monitor of the terminal 1.

25

The database 31 is able to analyze the implied meanings of an entered name in any language either based on numbers of strokes of the entered surname and given name or based on meanings or origins of words

constituting the entered surname and given name.

5 Please refer to Fig. 3 that shows a system of the present
invention for conducting fortune telling and character
analysis over Internet based on number of strokes of
an entered name. In this system, there are one more
terminals 1 and a host 3 connected to one another via
a communicating system 2, which is Internet in the
present invention, and a database 311 and an operating
10 unit 32 connected to the host 3. The database 311 is
able to compare an entered name, including a surname
and a given name in any language, with data stored in
the database 311 to locate numbers of strokes of all
letters included in the entered names as well as
15 numbers of strokes of the entered surname and given
name. The operating unit 32 sums up numbers of strokes
of the entered surname and given name provided by the
database 311 in predetermined manners to provide
analyses of fortune and any good or bad sign possibly
20 represented by the entered name.

Fig. 4 is a flowchart showing the operation of the
system of Fig. 3. An end user at a terminal 1 is
connected to the host 3 via the communicating system
25 2, which is Internet in the present invention. The
host 3 provides an input interface that is transmitted
to the terminal 1, so that the terminal 1 receives the
same input interface transmitted by the host 3. When
the end user enters a name at the terminal 1, including

V and W of the character or word constituting the surname and the given name X, Y and Z are summed according to the following formulas (1) to (5), so that results from the operations correspond to five factors that are important bases in analyzing the fortune and character of a person having the entered name. These five factors are Heaven, Human, Earth, External Environment, and Universe, which are sequentially denoted as A, B, C, D and E. The formulas (1) to (5) are as follows:

$$A \text{ (Heaven)} = U + 1 \quad (1)$$

$$B \text{ (Human)} = U + V \quad (2)$$

$$C \text{ (Earth)} = V + W \quad (3)$$

$$D \text{ (External)} = W + 1 \quad (4)$$

$$E \text{ (Universe)} = U + V + W \quad (5)$$

where U is the number of strokes of the first character X (i.e. the surname), V is the number of strokes of the second character Y (i.e. the first given name), and W is the number of strokes of the third character Z (i.e. the second given name).

Exact values for A, B, C, D and E are referred to as divine values of Heaven, Human, Earth, External Environment, and Universe, and could be easily obtained through operations on a computer. Some Chinese people have a surname that includes two Chinese characters or a given name that includes only one

Chinese character. In either case, the divine values of Heaven, Human, Earth, External Environment, and Universe must still be calculated in accordance with principles stipulated in the traditional Chinese fortune telling and character analysis, that is, the formulas (1) to (5). Although the five factors A, B, C, D and E have their respective meaning in terms of the traditional Chinese fortune telling and character analysis, they are not easily understood. To overcome this problem, the five factors A, B, C, D and E are sub-divided into ten major elements in the system of present invention to correspond to issues that are most concerned by all people. Please refer to Fig. 5B. The ten major elements are Destiny, Birth Date, Spouse, Parents, Business, Children, Brothers, Human Relation, Past, and Future.

The present invention is characterized in that it allows a user over Internet to enter his or her surname and given name in any language at a terminal. Then, numbers of strokes of letters constituting the entered surname and given name are compared with data stored in the database. There are many different foreign languages available for entering the user's surname and given name. However, the following embodiments of the present invention are based on entered names in English.

For the purpose of analyzing a user's name in English,

data about numbers of strokes for 26 English letters from A to Z in upper case are stored in the database 311 provided by the host 3 of the present invention, as shown in Fig. 6. For example, uppercase letter A is defined as having three strokes, uppercase letter B three strokes, uppercase letter C one stroke, uppercase letter D two strokes, and uppercase letter Z one stroke.

10 Please refer to Figs. 6 and 7A at the same time. When a user enters an English name as David Lin, that includes a surname "Lin" having only one word and a given name "David" also having only one word, the database 311 starts comparing the entered name with
15 data stored therein and searches for matched data. In doing so, all English letters included in the surname and the given name are separated and converted into upper case to obtain the numbers of strokes of these letters. More specifically, letters D, A, V, I, and
20 D included in the given name "David" respectively have 2, 3, 2, 3, and 2 strokes; and letters L, I, and N included in the surname "Lin" respectively have 1, 3 and 3 strokes. Thereafter, the operating unit 32 sums up the numbers of strokes of all English letters
25 included in the given name and in the surname to obtain total strokes of 12 and 7 for the user's given name and surname, respectively.

Please refer to Figs. 5A. In this figure, X

corresponds to the surname "Lin", Y to the single-word given name "David", and Z corresponds to nothing. U is the number of strokes of the surname X and is 7 in the embodiment of Fig. 7A, V is the number of strokes of the given name "David" and is 12 in the same embodiment, and W is defined as 1. From the above-mentioned formulas (1) to (5), it can be easily derived that the user's Heaven factor $A = U + 1 = 7 + 1 = 8$; the Human factor $B = U + V = 7 + 12 = 19$; the Earth factor $C = V + W = 12 + 1 = 13$; the External Environment factor $D = W + 1 = 1 + 1 = 2$; and the Universe factor $E = U + V + W = 7 + 12 + 1 = 20$. As can be seen in Fig. 5B, the ten major elements defined in the present invention separately correspond to one of the five factors A to E. After the exact values for the user's five factors are obtained through the above operation, the user's fortune and character are analyzed and judgment on any good or bad sign represented by these values is made based on the values of the five factors corresponding to the ten major elements.

Please refer to Fig. 7B. When a user enters an English name as David Jack Lin, that includes a surname "Lin" having only one word and a given name "David Jack" having two words, the database 311 starts comparing the entered name with data stored therein and searches for matched data. In doing so, all English letters included in the surname and the given name are separated and converted into upper case to obtain the

numbers of strokes of these letters. More specifically, the surname "Lin" has a total number of strokes of 7 and the two words of "David" and "Jack" of the given name have total numbers of strokes of 12 and 9, respectively. Thereafter, the operating unit 32 conducts operation to obtain the values of the user's five factors as 8 for the Heaven factor A, 19 for the Human factor B, 21 for the Earth factor C, 10 for the External Environment factor D, and 28 for the Universe factor E. After the values of the user's five factors are obtained through the above operation, the user's fortune and character are analyzed and judgment on any good or bad sign represented by these values is made based on the values of the five factors corresponding to the ten major elements.

Please refer to Fig. 7C. When a user enters an English name as Lin Min Hwa, that includes a surname "Lin" having only one word and a given name "Min Hwa" having two words, the database 311 starts comparing the entered name with data stored therein and searches for matched data. In doing so, all English letters included in the surname and the given name are separated and converted into upper case to obtain the numbers of strokes of these letters. More specifically, the surname "Lin" has a total number of strokes of 7 and both of the two words of "Min" and "Hwa" of the given name have a total number of strokes of 10. Thereafter, the operating unit 32 conducts

operation to obtain the values of the user's five factors as 8 for the Heaven factor A, 17 for the Human factor B, 20 for the Earth factor C, 11 for the External Environment factor D, and 27 for the Universe factor E. After the values of the user's five factors are obtained through the above operation, the user's fortune and character are analyzed and judgment on any good or bad sign represented by these values is made based on the values of the five factors corresponding to the ten major elements.

Alternatively, the host 3 of the present invention may conduct fortune telling and character analysis for a user based on meanings and origin of words constituting an entered name in any language, which is English in the illustrated example of Fig. 8. In this case, data stored in a database of the host 3 are implied meanings and origins of words when the same are used as names. For example, the word "David" as a name has an original meaning of seeking for power, sensitive, foresighted, brave, persistent, having a strong superiority complex, etc. Thus, from an analysis conducted by the system of the present invention, a person having the entered name of "David" would be judged as having the attribute of a leader. And, as another example, the word "Steve" as a name has an original meaning of disliking opposed conditions, handsome and sexy, being physically strong, determined, etc. Thus, from an analysis conducted by the system of the present invention, a person having

the entered name of "Steve" would be judged as loving peace and rational.

In brief, the present invention is able to conduct
5. fortune telling and character analysis based a name
in any language entered by the user at an
Internet-connected terminal. The analysis is made
either based on values of specially factors concerning
a person fortune obtained from numbers of strokes of
10 the entered names or based on implied meanings or
origins of words constituting the entered names. The
system of the present invention allows users to enter
names in any language and is able to conduct a quick
fortune and character analysis based on the entered
15 name. By including the system of the present invention
in a web site through Internet, it is possible to
attract more people to browse the web site.

The present invention has been described with some
20 embodiments thereof and it is understood that many
changes and modifications in the described embodiments
can be carried out without departing from the scope
and the spirit of the invention that is intended to
be limited only by the appended claims.
